

6.4 Knapsack Problem

Knapsack Problem

Knapsack problem.

- Given n objects and a "knapsack."
- Item i weighs $w_i > 0$ kilograms and has value $v_i > 0$.
- Knapsack has capacity of W kilograms.
- Goal: fill knapsack so as to maximize total value.

Ex: $\{ 3, 4 \}$ has value 40.

$$W = 11$$

Item	Value	Weight
1	1	1
2	6	2
3	18	5
4	22	6
5	28	7

Greedy: repeatedly add item with maximum ratio v_i / w_i .

Ex: $\{ 5, 2, 1 \}$ achieves only value = 35 \Rightarrow greedy not optimal.

Dynamic Programming: False Start

Def. $\text{OPT}(i) = \max \text{ profit subset of items } 1, \dots, i.$

- Case 1: OPT does not select item i.
 - OPT selects best of { 1, 2, ..., i-1 }
- Case 2: OPT selects item i.
 - accepting item i does not immediately imply that we will have to reject other items
 - without knowing what other items were selected before i, we don't even know if we have enough room for i

Conclusion. Need more sub-problems!

Dynamic Programming: Adding a New Variable

Def. $OPT(i, w) = \max$ profit subset of items $1, \dots, i$ with weight limit w .

- Case 1: OPT does not select item i .
 - OPT selects best of $\{1, 2, \dots, i-1\}$ using weight limit w
- Case 2: OPT selects item i .
 - new weight limit = $w - w_i$
 - OPT selects best of $\{1, 2, \dots, i-1\}$ using this new weight limit

$$OPT(i, w) = \begin{cases} 0 & \text{if } i = 0 \\ OPT(i-1, w) & \text{if } w_i > w \\ \max\{ OPT(i-1, w), v_i + OPT(i-1, w - w_i) \} & \text{otherwise} \end{cases}$$

Knapsack Problem: Bottom-Up

Knapsack. Fill up an n -by- W array.

```
Input: n, w1, ..., wN, v1, ..., vN

for w = 0 to W
    M[0, w] = 0

for i = 1 to n
    for w = 1 to W
        if (wi > w)
            M[i, w] = M[i-1, w]
        else
            M[i, w] = max {M[i-1, w], vi + M[i-1, w-wi]}

return M[n, W]
```

Knapsack Algorithm

$\xrightarrow{W + 1}$

	0	1	2	3	4	5	6	7	8	9	10	11
$n + 1 \downarrow$	0	0	0	0	0	0	0	0	0	0	0	0
\emptyset	0	0	0	0	0	0	0	0	0	0	0	0
{ 1 }	0	1	1	1	1	1	1	1	1	1	1	1
{ 1, 2 }	0	1	6	7	7	7	7	7	7	7	7	7
{ 1, 2, 3 }	0	1	6	7	7	18	19	24	25	25	25	25
{ 1, 2, 3, 4 }	0	1	6	7	7	18	22	24	28	29	29	40
{ 1, 2, 3, 4, 5 }	0	1	6	7	7	18	22	28	29	34	34	40

OPT: { 4, 3 }
 $\text{value} = 22 + 18 = 40$

$W = 11$

Item	Value	Weight
1	1	1
2	6	2
3	18	5
4	22	6
5	28	7

Knapsack Problem: Running Time

Running time. $\Theta(n W)$.

- Not polynomial in input size!
- "Pseudo-polynomial."
- Decision version of Knapsack is NP-complete. [Chapter 8]

Knapsack approximation algorithm. There exists a polynomial algorithm that produces a feasible solution that has value within 0.01% of optimum. [Section 11.8]
